```
This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see 296173-296494) and their encoded proteins (see y85792-Y86182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be useful or screen for compounds which interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene thorapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of

                                                     X20248 to X20402 represent polynucleotide sequences isolated from Bornelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as

Claim 2; Page 2-3; 59pp; English.

The present sequence encodes a novel Staphylococcus aureus glycoprotease
(gcp) polypeptide. This is isolated from a deposited strain
S. aureusWCUH29 containing the full length gcp gene. Gcp polynucleotides
and polypeptides are used as research reagents for the discovery of
treatments and diagnostics for diseases. The polynucleotides may be used
as a source of hybridisation probes, screening genetic mutations, and
as source of hybridisation probes, screening genetic mutations, and
are used to produce antibodies, in vaccine formulations, to identify
are used in the treatment of Helicobacter pylori infections, such as
gastrointestinal carcinoma, gastric ulcers, and gastritis. Other diseases
include osteomyelitis, septic arthritis, septic thrombophlebitis, acute
syndrome, and toxic shock syndrome. The polypeptides can also be used to
reat wounds and toxic shock syndrome. The polypeptides can also be used to treat wounds and body implants to prevent bacterial adhesion and

of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access the S.aureus DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or D-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The This sequence represents one of 5191 Staphylococcus aureus DNA sequences

8×333333333×8

```
This sequence encodes a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, evelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the

The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                       ö
humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrella genus. The products can also be used for detection of members of the Borrella genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

X20248 to X20402 represent polynucleotide sequences isolated from Bornelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of blosynthetic products, e.g. enzymes. Bornelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Bornelia causes epidemic and endemic relapsing fever, and Lyme borneliosis, more commonly known as

         Human xiap, hiap-1 and hiap-2 genes, and murine xiap, hiap-1 and hiap-2 genes (170836-41) respectively code for a new class of mammalian proteins (W19581-86) that are inhibitors of apoptosis (IAP). The hiap-1 and hiap-2 genes were cloned by screening a cregion. They were assigned to chromosome 11922-23 by FISH. IAP nucleic acids can be used to express IAP polypeptides in cells and animals to inhibit apoptosis, and as primers and probes to identify animals to inhibit apoptosis, as well as in methods for treating diseases and disorders involving apoptosis (anti-apoptotic gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding an inhibitor of apoptosis polypeptide - used to inhibit apoptosis in e.g. HIV or AIDS patients, and for detection of susceptibility to apoptotic disease

The nucleic acid is used for recombinant prodn. of human cellular inhibitor of apoptosis protein which modulates apoptosis regulation. The nucleic acids are useful in therapies where increased cell-specific apoptosis is desired, e.g. in restinosis, inflammatory disease states, myocardial infarction, glomerular nephritis, transplant rejection and infectious diseases, e.g. HIV. They can also be used in conditions requiring a reduction in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding cellular inhibitor of apoptosis proteins useful for apoptosis regulation in cells to reduce or increase apoptosis and for pharmacological screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 29.6; DB 18; Length 2589;

inhibit the expression of human Cellular Inhibitor of Apoptosis-1 (c-IAP-1). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research reagents (e.g. to distinguish between members of a biological pathway) and in kits. The present sequence represents the human cellular inhibitor of apoptosis-1 (GenBank accession number: U37547).
                    Cellular Inhibitor of Apoptosis-1; antisense; diagnostic; therapeutic; c-IAP-1; prophylaxis; infection; inflammation; tumor formation; ss.

This sequence encodes the human HIAP-2 protein, which is a inhibitor of apoptosis protein (IAP), and can be used in the method of the invention. The method is for enhancing apoptosis in cells from a mammal with proliferative disease by treatment with a compound that inhibits biological activity of an IAP or NAIP polypeptide. The inhibitory compounds are used to treat proliferative disease, specially cancers of ovary, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, liver nasopharnyx, thyroid,central nervous system, prostate, colon, rectum, cervix or endometrium, particularly to increase their sensitivity to chemotherapeutic agents. High levels of the IAP or NAIP proteins are detected in many cancers and are associated with poor prognosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             resistance to chemotherapeutic agents and mutations in p53 (it is suggested that wild-type p53 suppresses transcription of the IAP or NAIP genes). Transgenic animals are used for testing the effects of antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a human expressed sequence tag (EST) are polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, activin/inhibin activity, chemotractic/chemokinetic activity, activin/inhibin activity, chemotractic/chemokinetic activity, anti-inflammatory activity, cathority activity, anti-inflammatory activity, activity, anti-inflammatory activity, activity, receptor/ilgand activity, anti-inflammatory activity, activity, repeatority suppressor activity, tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           - derived from

The present sequence represents HKNG1 (Hong Kong new gene 1). HKNG1
is a gene associated with bipolar affective disorder (BAD). HKCNI
CO polynuclectides are useful to identify compounds modulating HKNG1 gene
expression or HKNG1 polypeptide expression/activity. Compounds inhibiting
co renhancing HKNG1 gene expression or activity; in individuals can then
co pecually neuropsychiatric disorders e.g. BAD, schizophrenia, or
KKNG1-mediated myopia disorders, such as early-onset autosomal
co ferborially neuropsychiatric disorders can be used in gene therapy
techniques to treat such disorders. They are also useful in diagnosis
co identify individuals having, or at risk of developing, HKNG1-mediated
co disorders due to mutations in the HKNG1 gene. Such mutations especially
result in the production of a protein with a different sequence to
the human full-length HKNG1 polypeptide or splice variant sequences,
co the human full-length HKNG1 polypeptide or splice variant sequences,
co resquences from different species) and to produce transgenic
co requences from different species) and to produce transgenic
cor animals.

N

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

/lab.host="Wholubur of the property of the protector paluescript II XR; Site_1: EcoRI; Site_2: XhOI; The mRNA was isolated from roots of Glycine max 'Supernod' plants generously donated by Dr. Gary Stacey. The seedlings were innoculated with Bradyrhizobium paponicus, strain USDAIIO priot to harvest. Stratagene's cDNA synthesis Kit (catalog number 200401) was used to synthesize the cDNA. First-strand synthesis was performed with 5-methyl dcrp, hence the ligated cDNA was hemimerthylated. A modification of Stratagene's first-strand synthesis primer was used. An 'anchor' nucleotide (V=A,C, or G) was added to the 3' end of the primer (GAGAGAGAGAGAGAGAGAGAGACACTGCTCGGG(T)8V) to anchor the primer at the 5' end of the poly(A) tract. After second strand synthesis, the cDNA ends were filled in with close for DNA polymersase, lighted to EcoRI adapters and subsequently phosphorylated. The XhOI site within the first-strand synthesis primer was then restricted by digestion with XhOI; all XhOI sites in the cDNA constructs were size-fractionated with a 500bp cutoff, using dibcoRL Life Technologies' cDNA size Fractionation column. The column eluent was then ligated into stratagene's pBluescript II XR Predigested vector (PBLuescript II SK(+) that has been digested with EcoRI And phosporylated by Stratagene's Both the and XhoI, and phosporylated by Strategene). Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=25). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell." A. Bolla, B., Marra, M., Hillier, L., Erpelding, J., Coryell, V., Khanna, A., Bolla, B., Marra, M., Hillier, L., Kucaba, T., Martin, J., Beck, C., Wylie, T., Underwood, K., Steptoe, M., Theising, B., Allen, M., Bowers, Y., Person, B., Swaller, T., Gibbons, M., Pape, D., Harvey, N., Schurk, R., Ritter, E., Kohn, S., Shin, T., Jackson, Y., Cardenas, M., McCann, P., Waterston, R. and Wilson, R. /lab.host="Notes" Data Bulasscript II XR; Site_I: ECORI; Site_2: Xhoi; The mana was solated from roots of Glycine max xhoi; The mana was solated from roots of Glycine max supernod' plants generously donated by Dr. Gary Stacey. The seedlings were innoculated with Bradyrhizoblum japonicus, strain GDAAll priot to harvest. Stratagene's cDNA synthesis Kit (catalog number 200401) was used to synthesize the CDNA. First-strand synthesis was performed with 5-methyl dorp, hence the ligated CDNA was hemimethylated. A modification of Stratagene's first-strand synthesis primer was used. An "anchor' nuclectide (V=A,C, or G) was added to the 3' end of the primer [GAGAGAGAGAGAGAACTAGTCTCGAG[T]18V] to anchor the primer at the 5' end of the Poly(A) tract. After second-strand synthesis, the CDNA ends were filled in with cloned Pfu DNA Polymerase, ligated to EcoRI adapters and subsequently phosphorylated. The XDNI site within the subsequently phosphorylated. The XDNI site within the first-strand synthesis primer was then restricted by digestion with XDOI; all XDOI sites the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500bp cutoff, constructs were size-fractionated with a 500bp cutoff, using GlbcoBRL Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated with EcoRI (PBluescript II SK(+) that has been digested with EcoRI (PBluescript II SK(+) that has been digested with plasmids with cDNA inserts, based on size (n=25). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ij

/note="Vector: pBluescript SR-; Site_1: EcoRI; Site_2:
Xhoi: cDNA was prepared from polyA+ enriched RNA from
roots harvested at 10, 17, 22, 31 and 38 days
post-inoculation with Glomus versiforme. The cDNA was
directionally ligated into the Unizap XR vector from
Stratagene and packaged using Glomacy versiforme. The containing cDNA inserts were excised
from the recombinant lambda-zap phage using Ex-assist
helper phage and propagated in SOLR cells."

XhoI; M. truncatula sterilised seeds were germinated for
72h at 25 C, before transplanting into a 1/3 Epoisses soil
2/3 calcined Terragreen mix in the presence of onion
root fragments colonized by the arbuscular mycorrhizal
fungus Glomus intraradices (Schenck & Smith, isolate LPAR)
). The plants were watered every day and twice a week with
a modified nutrient Long Ashton solution without phosphate
but with a high level of nitrate. After 3 weeks RNA was
extracted from whole root systems. CDNA was prepared from
polyA+ enriched RNA. The CDNA was directionally ligated
into Uni-zap XR vector from Stratagene and packaged using
Glapack Gold packaging extracts. Plasmids containing cDNA
inserts were mass-excised from phage stocks using ExAssit
helper phage and propagated in Solre cells. Clone ordering
and sequencing was performed by the Centre National de
Sequencing experienced by the Centre National de

RNA was extracted from root tips (1-3 cm). cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into Uni-zapxR vector from Stratagene and packaged using Gigapack Gold packaging extracts. Plasmids containing cDNA inserts were mass-excised from phage stocks using ExAssit helper phage and propagated in SOLR cells. Clone ordering and sequencing was performed by the Centre National de Sequencage (Gence Severy, France)."

RNA was extracted from root tips (1-3 cm). cDNA was prepared from poly4+ enriched RNA. The cDNA was directionally ligated into Uni-zapxR vector from Stratagene and packaged using Gigapack Gold packaging extracts. Plasmids containing cDNA inserts were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mass-excised from phage stocks using Exassit helper phage and propagated in SOLR cells. Clone ordering and sequencing was performed by the Centre National de Sequencing conscope. Evry, France)."

RNA was extracted from root tips (1-3 cm). cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally lighted into Uni-zapKR vector from Stratagene and packaged using Gigapack Gold packaging extracts. Plasmids containing cDNA inserts were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mass-excised from phage stocks using ExAssit helper phage and propagated in SOLR cells. Clone ordering and sequencing was performed by the Centre National de Sequencing (Genoscope, Evry, France)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Contact: Genoscope

On Jun 3, 1998 this sequence version replaced gi:2829860. Bases 94718-95865 of clone F14J9 overlap with bases 1-1148 of 'IGF' clone F2IM12, gb AC000132 e-mail for correspondence: arab&sequence.stanford.edu Genes with similarity to proteins in the databases are described as 'putative', '-like' or 'similar to'. Genes that have EST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are annotated based only on gene prediction software are described as 'hypothetical proteins' The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.orni.gov/section/index.html), GENSCAN (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), Fexa (V.Solovyev & A.Salmow, Sanger Centre, http://genomic.sanger.ac.uk/), and NATPIANTGANE.
